(2020-2021)

Declaration

Department of computer Engineering and Applications

GLA University, Mathura

17 km. Stone NH#2, Mathura-Delhi Road, P.O. – Chaumuha,

Mathura – 281406

I hereby declare that the work which is being presented in the Mini project -I “Patient’s Unique Identification app”, in partial fulfilment of the requirements for Mini Project-I viva voce, is an authentic record of my own work carried under the supervision of Mr. Vaibhav Diwan, Technical Trainer, GLAU.

Name of Candidate:

Course: B Tech

Year: III

Semester: VI

CERTIFICATE

This is to certify that the mini project report entitled "Patient's Unique Identification" submitted by Abhinav Bhardwaj, Aditya Singh Chauhan, Anvit Gupta has been carried out under the guidance of Mr. Vaibhav Diwan, Technical Trainer, Department of Computer Engineering & Applications, GLA University, Mathura.

Signature:

Date:

ACKNOWLEDGEMENT

The project work in this report is an outcome of continuous work over a period and drew intellectual support from various sources. We would like to articulate our profound gratitude to all those people who extended their wholehearted co-operation and have helped me in completing this project successfully.

We are thankful to Mr. Vaibhav Diwan for teaching and assisting me in making the project successful. We would also like to thank other fellow mates for guiding and encouraging me throughout the duration of the project.

Abhinav Bharadwaj (181500009)

Aditya Singh Chauhan (181500046)

Anvit Gupta (181500127)

ABSTRACT

We all can't disagree with the fact that there are so many people in our society who are patients of such kind of diseases which need a long duration of treatment. And changing multiple doctors in this long duration of treatment is very often. In some case, it may due to unsatisfactory treatment by his/her doctor, while in some cases patients are supposed to change their city because of other reasons, but in both cases, it becomes very hard to keep its medical history (like previous prescriptions, reports, test results, etc.) with him/her.

Chapter 01

1.1 General Introduction to the Project

Currently in our society, patient used to keep hard copy of reports and prescriptions that becomes very difficult to maintain. There is no central system in our country that provides a facility of accessing someone's medical history in case of any accident or emergency. We totally depend on patient or his/her family during treatment which results problematic delays.

We are going to design a system that will provide Signup and then Login facility to the patient. We'll try to help patient in maintaining record of previous reports and prescriptions. As well as our system will attach a Unique Patient Identification to every patient who creates account on our database. This Unique number will be used to view patient's report. We'll design an android app as well as a website to facilitate patient as well as guest. Guest view will be used in viewing report of any patient if you are having his/her Unique Identification Number. It'll be very important, if in case of any emergency, any paramedical staff, who is not having account on our database, wants to examine operate any patient then he/she can view patient's reports just by searching Patient's Unique Identification number.

Area of Computer Science

The computer has brought revolution in every sphere of human life, whether it is business, education field, governance, medical science etc. The computer has reduced the human work load, businesses are going global and everything is available at the click of mouse. Most of the patients have to go to hospital which is a very time-consuming task. By this application they can keep in touch with them.

Chapter 02

Problem Definition

Our system will provide a unique identifier to every patient that can be used to view his/her previous medical history. Our system will keep track of all the records, with proper updating and modification facilities as and when required. Patient will be able to login into his/her own database using same username and password set during signup process, also every patient can access, update and modify its own records through our system.

Chapter 03

Objectives of the Project

Unique Patient Identifier (UPI) will be an individual identification number of every patient issued by this system. The objective of this project is to collect Patient's basic details (like Name, DOB, Contact number, Blood Group, Address, etc.) as well as giving a facility to upload heap of reports and prescriptions, store them in a centralized database.

Chapter 04

Technology being used

Hardware Requirements:

- Computer System with minimum 8GB of RAM **Software**

Requirements:

- Windows/Linux OS
- Android Studio
- Visual Code Studio
- Robo 3T
- Postman
- Adobe XD

Programming language:

- Java Programming
- JavaScript
- MERN Stack

Chapter 05

Software Development Tools

Android Studio

Android Studio is the official integrated development environment (IDE) for Google's Android operating system, built on JetBrains' IntelliJ IDEA software and designed specifically for Android development. It is available for download on Windows, macOS and Linux based operating systems. It is a replacement for the Eclipse Android Development Tools (ADT) as the primary IDE for native Android application development.

Android Studio was announced on May 16, 2013 at the Google I/O conference. It was in early access preview stage starting from version 0.1 in May 2013, then entered beta stage starting from version 0.8 which was released in June 2014. The first stable build was released in December 2014, starting from version 1.0.

Features

The following features are provided in the current stable version:

Gradle-based build support

Android-specific refactoring and quick fixes

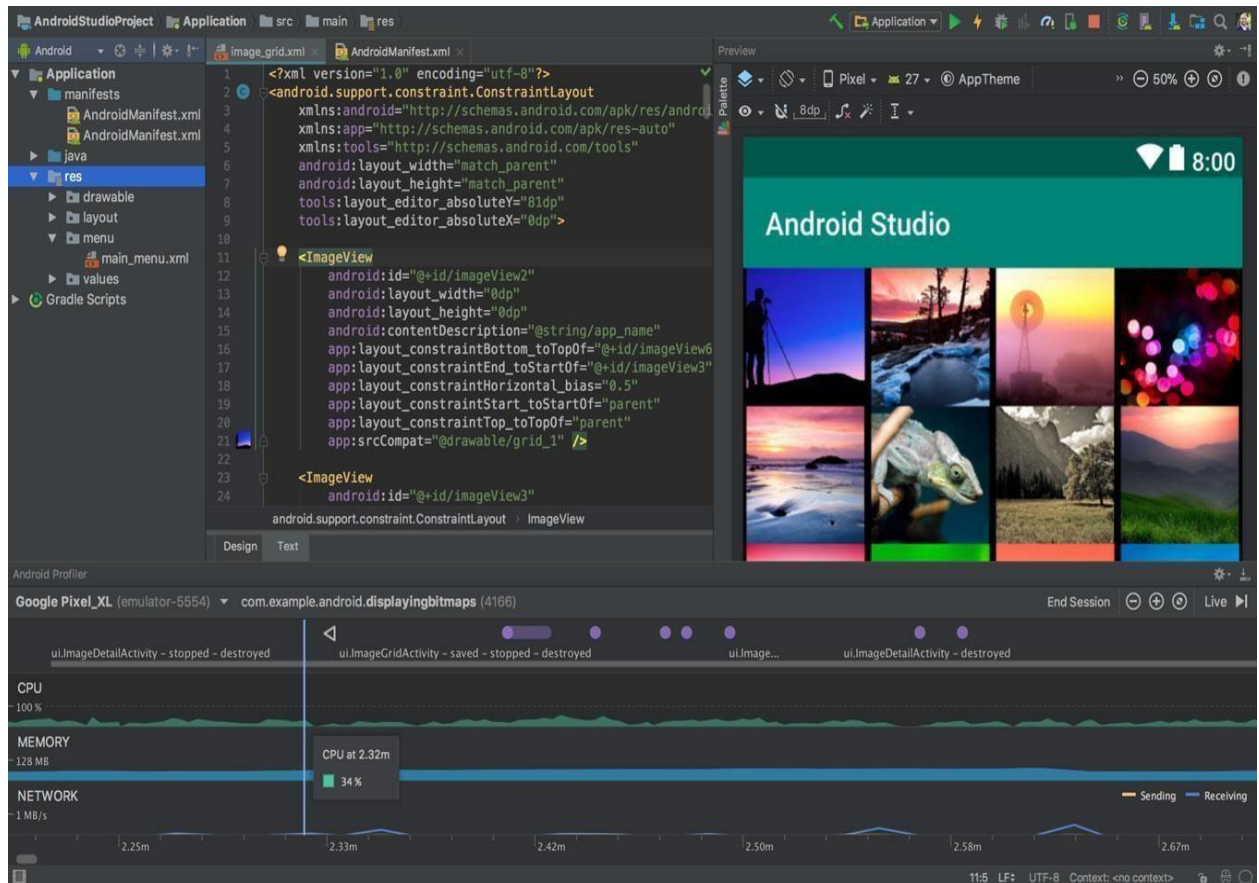

Lint tools to catch performance, usability, version compatibility and other problems

ProGuard integration and app-signing capabilities

Template-based wizards to create common Android designs and components

A rich layout editor that allows users to drag-and-drop UI components, option to preview layouts on multiple screen configurations Support for building Android Wear apps

Patient's Unique Identification

Chapter 06

Introduction to Android

5.1 Introduction to Android Studio

Android is a mobile operating system developed by Google. It is based on a modified version of the Linux kernel and other open source software, and is designed primarily for touchscreen mobile devices such as smartphones and tablets. In addition, Google has developed Android TV for televisions, Android Auto for cars, and Wear OS for wrist watches, each with a specialized user interface. Variants of Android are also used on game consoles, digital cameras, PCs and other electronics.

Initially developed by Android Inc., which Google bought in 2005, Android was unveiled in 2007, with the first commercial Android device launched in September 2008. The current stable version is Android 9 "Pie", released in August 2018. Google released the first beta of the next release, Android Q, on Pixel phones in March 2019. The core Android source code is known as Android Open Source Project (AOSP), which is primarily licensed under the Apache License.

Features:

Interface

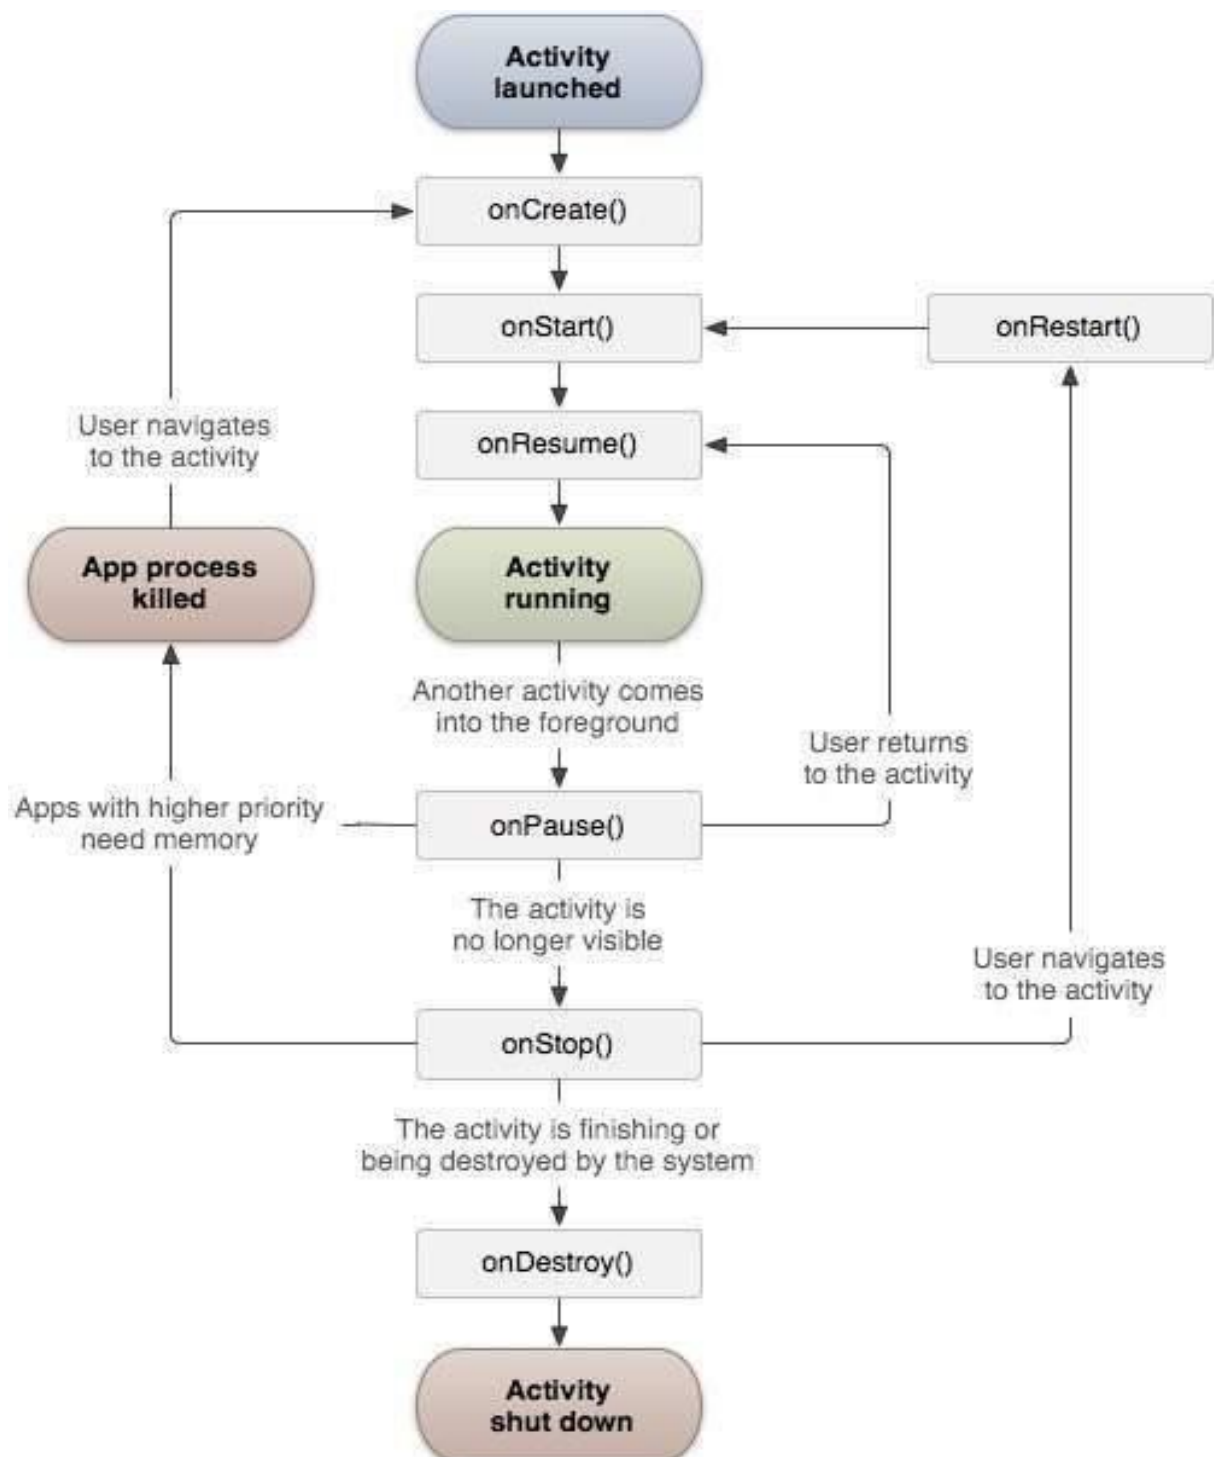

Applications

Memory management

5.2 Installation

5.3 Basic of Android

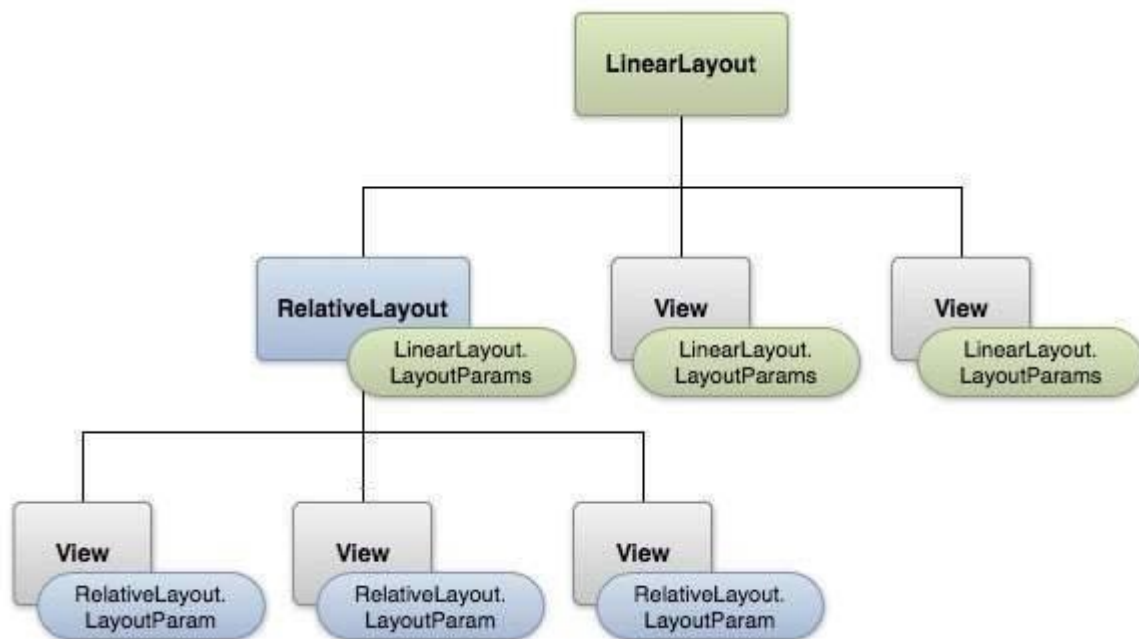

The basic building block for user interface is a View object which is created from the View class and occupies a rectangular area on the screen and is responsible for drawing and event handling.

View is the base class for widgets, which are used to create interactive UI components like buttons, text fields, etc.

The View Group is a subclass of View and provides invisible container that hold other Views or other View Group and define their layout properties.

At third level we have different layouts which are subclasses of View Group class and a typical layout defines the visual structure for an Android user interface and can be created either at run time using View/View Group objects or you can declare your layout using simple XML file main_layout.xml which is located in the res/layout folder of your project.

Chapter 07

Methodology

We are using Android Java and React based Webpage Portal as the frontend with the backend made using MongoDB. To see what's inside the android application a user has to login, if the user is not register, he/she can also register himself/herself. App will keep records of patient's reports as well as past health issues which we have feed there.

The modules used in this app are listed as follows:

1. Main Dashboard
2. My Profile
3. BMI Calculator
4. Upload Record
5. Records
6. Logout

Chapter 08

Implementation Details

App Development

i. Backend Development:

The technology used for developing backend is MongoDB. Basically we have implemented the backend part using Mongo. We implemented an admin panel to monitor all the activities which will be happening in the android application. The owner of this application is having one admin login username and password, only the admin can add or remove the data, the changes will be reflected to the android application. The data will be sent to the android application using API's

An application program interface (API) is a set of routines, protocols, and tools for building software applications. Basically, an API specifies how software components should interact. The data will sent in JSON format.

JSON (JavaScript Object Notation) is a lightweight data-interchange format. It is easy for humans to read and write. It is easy for machines to parse and generate.

- ##### ii. Frontend Development:
- We are using android studio, the tool which is used to develop android applications. The technology used for developing frontend is Android and Java. User will have to register themselves before login. We are parsing the data coming in JSON from the backend and displaying it on android application.

The modules used in this app are listed as follows:

1. Sign In – will use to sign in to the account.
2. Sign Up – will use to register his/her self.
3. Dashboard – It consist of 6 modules:
 - a. My Profile – It will show the profile of the user
 - b. Records – It will keep records of reports.

- c. BMI Calculator – It will calculate BMI of user by some inputting some variables
- d. Upload Record – It will use to upload/save his/her records.
- e. To-do – will ease you to mark to do work.

Webpage based Portal: We are working on this in two parts viz frontend and backend. Firstly, we are working on backend after that will move towards frontend. There might be some changes in the backend while working with frontend.

i. Backend Development: The project commences with designing of fundamental patient schema and document schema. We will use APIS for creating different routes. Unique Patient Identification Number (UPI) will be generated by the server every time the new user creates his/her account. We will differentiate user as patient and admin with the help of middleware. Admin will be able to use few more functionalities than patient like viewing total number of users, etc. The data will be sent to backend using APIs.

An application program interface (API) is a set of routines, protocols and tools for building software applications. Basically, an API specifies how software components should interact.

The data will be sent in JSON format.

JSON is a lightweight data-interchange format it is easy for humans to read and write. It is easy for machines to parse and generate.

We are using MongoDB Atlas for cloud storage during development phase because of its flexibility and scalability of document database, available as a fully managed service.

MongoDB Atlas is the global cloud database service for modern applications. Deploy fully managed MongoDB across AWS, Azure, or GCP. Best-in-class automation and proven practices guarantee availability, scalability, and compliance with the most demanding data security and privacy standards.

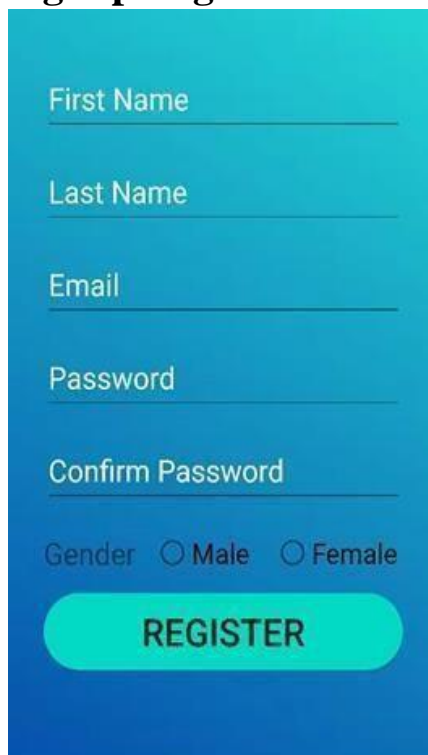

ii. Frontend: We will be using React, HTML, Bootstrap for frontend development part. On home page, there will be basic functionalities like BMI calculator or viewing public details of any patient using UPI. But to store his/her records, he/she has to create account using Signup Page and then sign in using Sign In Page. After signing in into account, there will be various modules like My Profile, Records, Upload Record, BMI Calculator, Sign-out etc.

Main Dashboard

A screenshot of a "BMI Calculator" app. The background is a vibrant gradient of purple, blue, and orange. The title "BMI Calculator" is at the top in a bold, black, italicized font. Below the title are two input fields: "Your Weight in Kg" and "Your Height in cm", each with a rounded rectangular border. Below these fields is a large purple button with the text "CALCULATE" in white, bold, italicized font. Below the button is the text "Result" followed by "BMI = ?". At the bottom is another large purple button with the text "RESET" in white, bold, italicized font. The bottom of the screen shows a black navigation bar with three white icons: a back arrow, a circle, and a square.

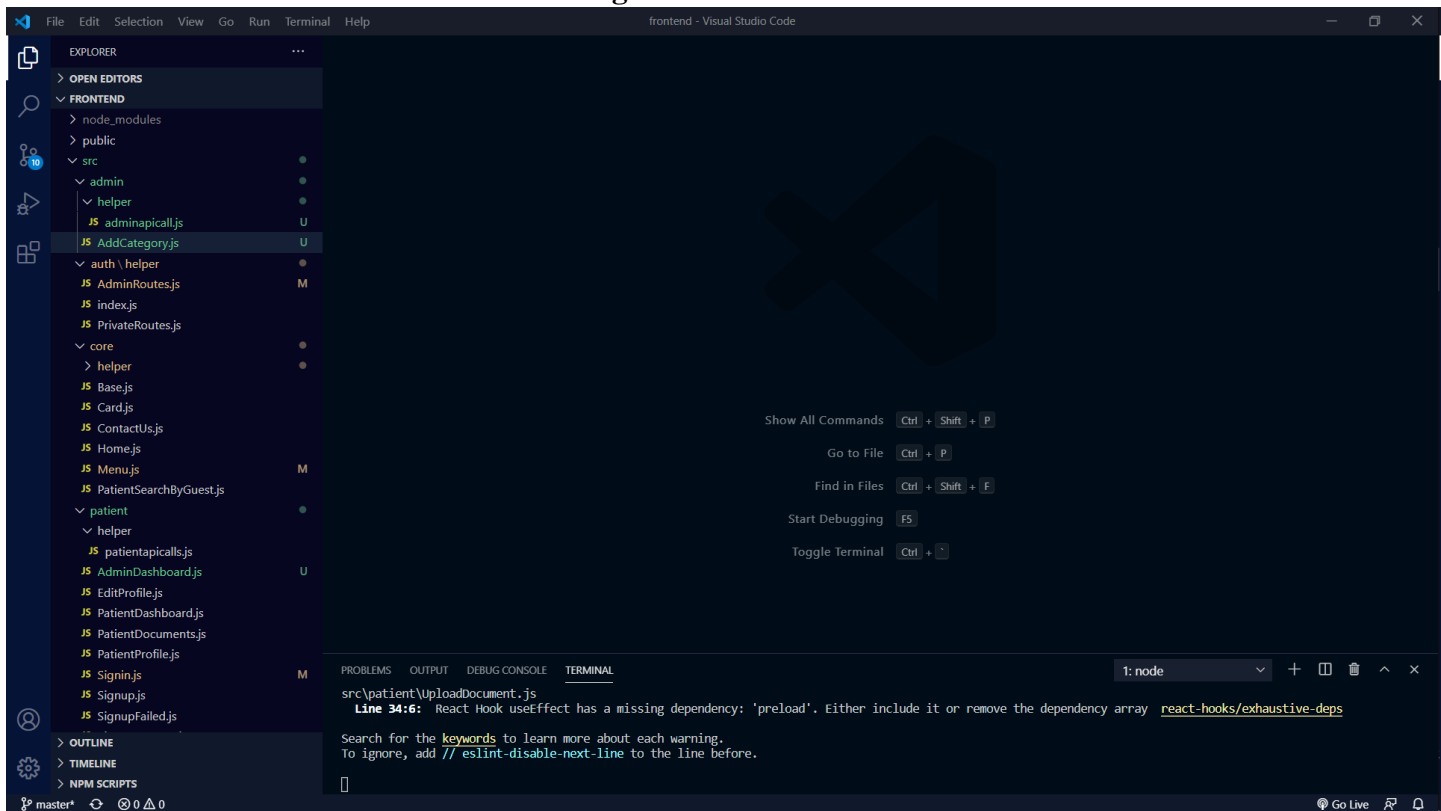

Patient's Unique Identification

The screenshot shows a web browser window with the title "Patient's Unique Identification" and the URL "localhost:3000/patient/uploadDocuments". The main content area has a light blue background and contains a white box with the following elements:

- Upload your Document**: A heading in bold black text.
- Prescribed/Tested by :**: A label followed by a text input field containing "Dr. ABCD".
- Category of document :**: A label followed by a dropdown menu. The dropdown is open, showing three options: "Select", "Prescription", and "Report". "Prescription" is currently selected and highlighted in grey.
- File Selection**: A green button labeled "Choose File" and a text label "No file chosen".
- Max. Size of file should be below 2.5 MB**: A text label.
- Upload**: A green button.

The footer of the page is dark blue and contains the following elements:

- For any queries**: A heading in bold white text.
- Contact Us**: A red button.
- Place to manage all your Medical Adherence**: A text label in white.

For health workers, medical masks are essential personal protective equipment when engaging with patients with suspected, probable or confirmed COVID-19. Respirator masks (such as FFP2, FFP3, N95, N99) should be used in settings where procedures generating aerosols are performed and must be fitted to ensure the right size is worn.
